Q: How to store user sign-in credentials in api access backend I am creating an application where the user needs to sign in using credentials they have provided. The credentials are stored securely in the user's machine. I am not storing the passwords in a database as it is not recommended. I don't need the credentials to be stored by my application. What I want is a way to store these credentials so that the endpoint can validate them when the user attempts to access the API. What I am thinking of is using Google OAuth for authentication and storing the refresh token(s) in the API access backend. I am just not sure if there is a better way to do it? A: You can create a oauth2 token the user can use to exchange their google credentials for a refresh token which you can use to reauthenticate them. Although with google this would be easiest to use their own oauth2 server. There is some useful information on how to do that here Q: Getting an array of values with jquery I'm new to the.length property of an object. I have a friend object array in which I want to show some of the items in the Friend Class. So basically I want to retrieve the value of the name property from each object in the array. My Friend class object looks like this: public class Friend { public int UserID { get; set; } public string[] Name { get; set; } } How do I access the Name property? I get the friend list from a database and I want to display the name field of the Friend class. I can get the list of friends from the database using: Friend[] newFriends = new Friend[] { //Friend.Friends }; dataproduct.DataSource = newFriends; dataproduct.DataBind(); But what is the next step? Thank you! A: The following code would be read more like "find the names of the friends": var names = dataproduct.DataSource

Q: Is there a way to turn the Earth into a supernova? It seems like if we were to get the two Solar Systems to meet up and merge a supernova could happen. But... what if we are talking about a couple Solar Systems? Let's say the two Solar Systems were a couple thousand light years apart and a big star was in the middle. Imagine that the star was of the same size/mass as the Sun. What if that star just blew, like exploded, and that took the two Solar Systems with it? Would that mean the end for Earth, since we're just one of many planets orbiting that star? A: The coalescence of the two star systems is, by itself, not likely to lead to a supernova. The death of the star as a nuclear burning source, and its associated expulsion of all of its mass, will not lead to a supernova because of the small mass of the remnant. The more likely scenario is that the two red giants will spiral into each other. In this case, they both reach a critical point where they have equal mass, about one and a half solar masses, and in so doing both shed most of their envelopes in a common event called a common envelope, and likely merge into a single star. Now there is a considerable chance that this will lead to a supernova. The fact that there's a third star, the blue star, is important here, and important for the other members of the planetary systems, as the orbital energy liberated by the merger of the red giants can eject anything close enough to the other planets, or even the other star. This is really the origin of the famous Brown Dwarf, a star like Jupiter about twice the mass of Jupiter, orbiting a red giant that has left its envelope and is accreting mass from the giant, and whose strong magnetic field shapes the trajectory of the planet as it orbits. Derivation of hematopoietic stem cells from human embryonic and fetal stem cells. The quest for ethical stem cells has prompted attention to the biology of human embryonic stem cells (hESC) and to the derivation of related human embryonic and fetal stem cells. Derivation of human hematopoietic stem cells (HSC) from hESC is difficult and has not been successful to date. We have sought to improve the likelihood of
